

Please replace the abstract with the following rewritten one.

The invention provides a method and a system for transferring electronic mails. When an electronic mail provider detects a new electronic mail, then a transmission signal is actively transmitted to a receiving terminal assigned by user. Next, after the electronic mail provider receives a response message from the receiving terminal, identification information of the electronic mail is transferred to the receiving terminal. The invention also provides a method and a system for displaying identification information of electronic mail on a mail server. The electronic mail provider transforms the identification information into a transmission signal, and then transfers the transmission signal to users. The transmission signal is transferred to the users through a receiving terminal, and the transmission signal is re-transformed into the identification information of electronic mail, then the identification information is displayed on the receiving terminal.
